About

This application is for doctors surgery / clinic. It provides a user-friendly command-line interface for registering patients, doctors and nurses. Also, it provides the ability to generate appointment schedules for doctors and nurses, reserve / cancel appointments for patients, write consultations and issue prescriptions. Object-Oriented programming methodology was used for this application according to the following design:

Data persistence was managed through csv files.

Getting Started

The following instructions will guide you on how to run this python script.

Prerequisites

Python 3 is needed to run this project.

If you don't have python installed on your computer, follow this link to install python on your computer [python](#).

You can check if you have python 3 installed by running the following command on the terminal (MacOS) or command prompt (Windows)

```
python --version
```

Example output:

```
Python 3.9.9
```

Running the script

- Download the project folder [DoctorSurgery](#)
- Open the terminal on MacOS or the command prompt on Windows 7/10.
- Go to the directory that contains the project files. Example:

In MacOS:

```
cd Downloads/DoctorSurgery/
```

In Windows:

```
cd Downloads\DoctorSurgery\
```

- Run the script by typing the following command

```
python main.py
```

Main screen will look like this:

Please select one of the options below:

```
1: Receptionist
2: Nurse
3: Doctor
4: Administration
-1: To return to the previous menu
0: Quit
```

```
> █
```
